

## EXHIBIT G

### APPLICATION OF THE '047 CLAIMS 16-18 TO THE DISCLOSURE OF THE

#### '047 APPLICATION

<u>'047 CLAIMS</u>	<u>'047 APPLICATION</u>
<p>16. A collapsible pet housing structure comprising:</p> <p>a floor panel having a pair of parallel sides and a pair of ends extending between the sides;</p> <p>a pair of generally opposing walls hingedly attached to the parallel sides of said floor panel, each wall comprising at least two generally planar wall panels connected to one another by a hinge connection, each of the wall panels having an external surface and an internal surface, the internal surface of the wall panels of one wall facing the internal surface of the wall panels of the opposing wall, the hinged connection between the wall panels allowing the wall panels to cooperate with one another to retain the external surfaces of the wall panels at an angle greater than 180 degrees relative to one another, so that the hinged connection allows movement of the wall panels from:</p> <p>a first position where the external surfaces of the wall panels are at an acute angle relative to one another</p> <p>to a second position where the external surfaces of the wall panels are retained at an angle greater than 180 degrees relative</p>	<p>Page 1, lines 1-3. "The present invention relates to foldable/collapsible structures and more particularly a lightweight animal shelter..."</p> <p>Page 14, line 15 – Page 15, line 15. "In summary form the present invention relates to a collapsible/foldable structure comprising a top roof and a bottom platform...a pair of sidewalls are provided each pivotably attached to said roof to facilitate inward collapse of said sidewalls when said sidewalls are pivoted toward said bottom platform, said sidewalls defined by an upper and middle section including said lower vertically disposed side section, wherein said upper and middle sections are pivotally attached to one another and said middle and lower sections are pivotally attached to one another so that said upper and middle sidewall sections can be pivoted inward towards said bottom platform...The sidewalls contain an outer and inner surface thereof..." See also, Figs 1-25.</p> <p>See, Figs. 1-2, wherein the external surfaces of the upper 16 and middle 18 sidewalls are at an acute (less than 180 degree) angle relative to one another.</p> <p>See again, Fig. 1. Hinge connection 22 on the external surface of the upper 16 and middle 18 contains a space that allows</p>

<p>to one another;</p> <p>a roof panel, the roof panel being of a weight and extending between the walls and being hingedly connected to said walls; and</p> <p>a pair of endwalls, each endwall being hingedly attached to said floor panel at opposing ends of the floor panel, the endwalls pivoting to a generally normal position with said floor panel to cooperate with said wall panels when said wall panels are in said second position to retain the external surfaces of the wall panels at the second position relative to one another, so that the roof panel is supported by said endwalls when said wall panels are at the second position.</p> <p>17. A collapsible pet housing structure comprising:</p> <p>a floor panel having a pair of parallel sides and a pair of ends extending between the sides;</p> <p>a pair of generally opposing walls hingedly attached to the parallel sides of the floor panel, each of the walls comprising at least two generally planar wall panels hingedly connected to one another along a hinge line, each of the wall panels having an external surface and an internal surface, the internal surface of the wall panels of one wall facing the internal surface of the wall</p>	<p>movement of the upper 16 and middle 18 sidewalls such that the external surfaces would be at an angle greater than 180 degrees relative to one another. See also, <b>Fig. 15</b> wherein the external surfaces of the sidewalls are shown at an angle greater than 180 degrees relative to one another.</p> <p>See again, <b>Figs. 1-25</b> which all identify the use of a roof panel hingedly connected to side panels.</p> <p>See, page 17, lines 7-8. "Turning next to <b>Fig. 4</b>, as better illustrated therein, front wall [or endwall] 29 is shown pivoting inwardly into structure along pivot edge 36.</p> <p>Page 1, lines 1-3. "The present invention relates to foldable/collapsible structures and more particularly a lightweight animal shelter..."</p> <p>Page 14, line 15 – Page 15, line 15. "In summary form the present invention relates to a collapsible/foldable structure comprising a top roof and a bottom platform...a pair of sidewalls are provided each pivotably attached to said roof to facilitate inward collapse of said sidewalls when said sidewalls are pivoted toward said bottom platform, said sidewalls defined by an upper and middle section including said lower vertically disposed side section, wherein said upper and middle sections are pivotally attached to one</p>
--	--

panels of the opposing wall, the hinged connection between the wall panels allowing the wall panels to cooperate with one another to retain the external surfaces of the wall panels at an angle greater than 180 degrees relative to one another, so that the hinged connection allows movement of the wall panels from:

a first position where the external surfaces of the wall panels are at an acute angle relative to one another

to a second position where the external surfaces of the wall panels are retained at an angle greater than 180 degrees relative to one another by a pair of endwalls,

each endwall being hingedly attached to said floor panel at opposing ends of the floor panel, the endwalls pivoting from a position where both endwalls lie over said floor panel to a generally normal position with said floor panel to cooperate with said wall panels when said wall panels are in said second position to retain the external surfaces of the wall panels at the second position relative to one another; and

a roof panel, the roof panel being of a weight and extending between the walls and being hingedly connected to said walls, so that the roof panel is at least partially supported by said walls when said wall panels are at the second position relative to one another, so that the roof panel cooperates with the wall panels and the

another and said middle and lower sections are pivotally attached to one another so that said upper and middle sidewall sections can be pivoted inward towards said bottom platform...The sidewalls contain an outer and inner surface thereof..." See also, Figs 1-25.

See, Figs. 1-2, wherein the external surfaces of the upper **16** and middle **18** sidewalls are at an acute (less than 180 degree) angle relative to one another.

See again, **Fig. 1**. Hinge connection **22** on the external surface of the upper **16** and middle **18** contains a space which allows movement of the upper **16** and middle **18** sidewalls such that the external surfaces would be at an angle equal to or greater than 180 degrees relative to one another. See also, **Fig. 15** wherein the external surfaces of the sidewalls are at an angle greater than 180 degrees relative to one another.

See, page 17, lines 7-8. "Turning next to **Fig. 4**, as better illustrated therein, front wall [or endwall] **29** is shown pivoting inwardly into structure along pivot edge **36**."

See again, **Figs. 1-25** which all identify the use of a roof panel hingedly connected to side panels.

endwalls to maintain the wall panels in the second position.

18. A method for creating a collapsible pet housing structure, the method comprising providing:

a floor panel having a pair of parallel sides and a pair of ends extending between the sides;

a pair of walls hingedly connected to the floor panel and comprising at least two generally planar wall panels hingedly connected to one another along a hinge line, each of the wall panels having an external surface, the hinged connection between the wall panels allowing the wall panels to cooperate with one another to retain the external surfaces of the wall panels at an angle greater than 180 degrees relative to one another, so that the hinged connection provides movement of the wall panels from:

a first position where the external surfaces of the wall panels are at an acute angle relative to one another to a second position where the external surfaces of the wall panels are retained at an angle greater than 180 degrees relative to one another, the wall panels cooperating with one another to retaining the external surfaces of the wall panels at the second position relative to one another; and

Page 1, lines 1-3. "The present invention relates to foldable/collapsible structures and more particularly a lightweight animal shelter..."

Page 14, line 15 – Page 15, line 15. "In summary form the present invention relates to a collapsible/foldable structure comprising a top roof and a bottom platform...a pair of sidewalls are provided each pivotably attached to said roof to facilitate inward collapse of said sidewalls when said sidewalls are pivoted toward said bottom platform, said sidewalls defined by an upper and middle section including said lower vertically disposed side section, wherein said upper and middle sections are pivotally attached to one another and said middle and lower sections are pivotally attached to one another so that said upper and middle sidewall sections can be pivoted inward towards said bottom platform...The sidewalls contain an outer and inner surface thereof..." See also, Figs 1-25.

See, Figs. 1-2, wherein the external surfaces of the upper 16 and middle 18 sidewalls are at an acute (less than 180 degree) angle relative to one another.

See again, Fig. 1. Hinge connection 22 on the external surface of the upper 16 and middle 18 contains a space which allows movement of the upper 16 and middle 18 sidewalls such that the external surfaces would be at an angle equal to or greater than 180 degrees relative to one another. See also, Fig. 15 wherein the external surfaces of the sidewalls are at an angle greater than 180 degrees relative to one another.

a pair of endwalls, each endwall being hingedly attached to said floor panel at opposing ends of the floor panel, the endwalls pivoting from a position where both endwalls lie over said floor panel to a generally normal position with said floor panel to cooperate with said wall panels when said wall panels are in said second position to retain the external surfaces of the wall panels at the second position relative to one another; and a roof panel, the roof panel being of a weight and extending between the walls and being hingedly connected to said walls; and

at least partially supporting the roof panel with said walls when said wall panels are at the second position relative to one another, and so that the roof panel cooperates with the wall panels such that the weight of the roof panel assists in maintaining the wall panels in the second position.

See, page 17, lines 7-8. "Turning next to **Fig. 4**, as better illustrated therein, front wall [or endwall] **29** is shown pivoting inwardly into structure along pivot edge **36**."

See again, **Figs. 1-25** which all identify the use of a roof panel hingedly connected to side panels.

**Fig. 1** illustrates roof panel **30** supported by side wall panels **12** and **14**. See also, page 15, line 26 to page 16, line 5.
